

The OBD-killer - Stop annoying fault codes

Even smallest changes on modern engine management systems can show up the malfunction indicator light. In the case of small series or tuning solutions this problem can often be solved with big efforts only.

With the OBD-KILLER we have developed a universal solution. This device periodically checks and deletes pending and confirmed error codes. Therefor sporadically occurring fault codes can be isolated. If a new fault code occurs that deviates from the expected fault codes, the deletion process stops. Thus, the functionality of the fault memory is maintained.

The OBD-KILLER is available in two versions: "standard" for the fast, simple solution and "premium" for the professional claim of course with EC type approval.
